Errors

Upon starting the application, I see the following error window show. The program doesn't load."Error while unpacking program code LP5. Pease report to author"How can I resolve this, thanks!

Here's a tip from user Kevin Black, regarding a registry switch that prevents windows from triggering the LP5 error:

I attempted uninstall/re-install but that did not help. I got to thinking that yesterday I came across this article about activating a Windows security feature which required an addition to the registry. I removed that entry and now ClipMate works again. I saw some other people commenting that it could potentially crash some programs. Here is a link to the article https://betanews.com/2017/11/18/windows-aslr-security/
