

Pasting

PowerPaste Scrolls Quickly By Itself

The "fast scroll" problem happens when applications auto-paste data into themselves, usually into a buffer for inspection. This often does something really important (excuse the sarcasm) like turning a paste menu or button on or off.

Starting with ClipMate 6, the "powerpaste shield" option can sometimes defeat the clipboard snooping - but not always. You can try turning it on or off, to see if it improves the situation. See [tools](#) | [options](#) | [pasting](#).

Otherwise, you need to disable the clipboard monitoring in (or shut down) whatever program is monitoring the clipboard. Usual culprits are FTP clients, "download helpers", PGP clients, the Office2000/XP clipboard, Copernic, any any other clipboard-aware programs such as clipboard spellcheckers, printscreen utilities, etc. Remote Desktop applications often do this too, and usually have an option to sync the clipboard between sessions - turn it off.

Some specific programs known to cause this:

- Copernic
- CCED by <http://www.cced.com.cn/>
- Office Clipboard - [see instructions to turn off](#) (updated March 1, 2013).
- Tab Browser Extensions (TBE) by Hiroshi (Mozilla/Firebird) - [instructions to turn off](#)
- PowerPro
- emule - <http://www.emule-project.net/> (can be turned off in User Preferences)
- USDownloader
- FlashGet / FlashGot for FireFox
- Google Earth - why in the world does THAT need to monitor the clipboard?
- iTunes
- Any sort of Remote Desktop
- Macro Programs
- FDM Download Manager

PLEASE consider leaving comments if you find an application that is causing trouble, so that it will help other users troubleshoot this.
